

Experiment : 02

Title : Use var, let, const, and demonstrate basic features like template literals and destructuring; build a billing calculator with user input.

Software/Tools Required : HTML5, CSS3, JavaScript, VS Code , Google Chrome

Theory : JavaScript provides var, let, and const for declaring variables with different scopes and behaviors. It also supports modern ES6 features such as template literals for easy string formatting and object destructuring for extracting object properties into variables. The prompt() function is used to accept input from the user. In this experiment, these features are used to develop a billing calculator that accepts product details, calculates the subtotal, GST (18%), and total amount, and displays a formatted bill dynamically on the web page.

A screenshot of a web browser window showing a dialog box. The dialog box has a title bar that says "127.0.0.1:5500 says". Inside the dialog box, there is a label "Enter Customer Name:" followed by a text input field containing the text "User". At the bottom right of the dialog box, there are two buttons: "OK" and "Cancel".

A screenshot of a web browser window showing a dialog box. The dialog box has a title bar that says "127.0.0.1:5500 says". Inside the dialog box, there is a label "Enter Product Name:" followed by a text input field containing the text "Coffee". At the bottom right of the dialog box, there are two buttons: "OK" and "Cancel".

A screenshot of a web browser window showing a dialog box. The dialog box has a title bar that says "127.0.0.1:5500 says". Inside the dialog box, there is a label "Enter Product Price (₹):" followed by a text input field containing the text "248". At the bottom right of the dialog box, there are two buttons: "OK" and "Cancel".

A screenshot of a web browser window showing a dialog box. The dialog box has a title bar that says "127.0.0.1:5500 says". Inside the dialog box, there is a label "Enter Quantity:" followed by a text input field containing the text "1". At the bottom right of the dialog box, there are two buttons: "OK" and "Cancel".

Experiment-02

Result : The billing calculator was successfully developed using JavaScript. It accepted user input for the customer name, product details, price, and quantity, calculated the subtotal, GST (18%), and total amount, and displayed a well-formatted billing receipt on the web page.

Conclusion: This experiment demonstrated the use of JavaScript variable declarations (var, let, and const), prompt() for user input, template literals for formatted output, and object destructuring for efficient data handling. It also helped in understanding how JavaScript can be used to perform calculations and create interactive web applications.
