

Experiment No: 02

Title : Demonstrate inline, internal, and external JavaScript; use console methods; create a webpage showing user info and a welcome message.

Software/Tools Required: HTML5, CSS3, JavaScript, VS Code , Google Chrome

Theory: JavaScript can be included in a web page using inline, internal, and external methods. Inline JavaScript is written directly within HTML elements, internal JavaScript is placed inside the <script> tag, and external JavaScript is stored in a separate .js file. JavaScript also provides various console methods such as console.log(), console.info(), console.warn(), console.error(), and console.table() for debugging and displaying information. In this experiment, these techniques are used to display a welcome message, collect user information, and demonstrate different ways of writing JavaScript in a web page.

Founder: Prof. Dr. S. B. Mujumdar, M. Sc., Ph. D. (Awarded Padma Bhushan and Padma Shri by President of India)

Experiment-01

Result: The webpage was successfully created using inline, internal, and external JavaScript. It displayed a welcome message, accepted user information through input prompts, and demonstrated various console methods such as `console.log()`, `console.info()`, `console.warn()`, `console.error()`, and `console.table()` for debugging and output.

Conclusion: This experiment demonstrated the different ways of including JavaScript in a web page and the use of console methods for debugging. It also showed how JavaScript can interact with users by accepting input, displaying dynamic content, and enhancing the interactivity of web applications.
